Task 4 — Presentation Script

Hello, and thank you both for your time. I'm here to walk you through the analysis of our online retail data and, most importantly, what it tells us about where to focus as we plan for expansion. I'll cover how I prepared the data, then take each of your four questions in turn, and close with where I see the strongest opportunities.

Let me start with the data itself, because everything that follows depends on it being trustworthy. The raw file held just under 542,000 transactions. As I worked through it, two issues stood out. First, customer returns were recorded as negative quantities, and if I'd left those in, they'd have quietly understated our revenue. Second, a number of unit prices were entered as zero or below, which are clearly data-entry errors. So before any analysis, I applied two checks: every record had to have a quantity of at least one unit, and a unit price above zero. Anything that failed was excluded. That removed roughly 11,800 flawed records and left us with about 530,000 clean transactions. I then calculated a revenue figure for every line, quantity times unit price. So the numbers I'm about to show you are clean and defensible.

Your first question was about the revenue trend across 2011, month by month, to understand seasonality. This line chart shows it clearly. Revenue holds fairly steady through the first half of the year, then climbs sharply from September, peaking in November at around 1.5 million. You'll notice December drops, but that's simply because our data ends on the ninth of December, so it's an incomplete month, not a real decline. The real signal here is a strong pre-holiday surge in the autumn. For planning, that means inventory, staffing, and marketing spend should be ramped up ahead of that window so we capture the peak rather than scramble to meet it.

Your second question asked which countries generate the most revenue once we set the UK aside, since the UK dominates and you wanted to see the opportunity beyond our home market. This chart shows the top ten by revenue, with quantity sold shown alongside. The Netherlands and Ireland lead clearly, followed by Germany, France, and Australia. What's valuable is comparing the two bars together: these markets aren't just placing lots of small orders, they're producing real revenue at volume. That combination is exactly what makes them credible expansion targets, because the demand is already proven.

Third, you wanted to understand your most valuable customers. This chart ranks the top ten by revenue, from highest down to lowest. The single largest customer contributes around 280,000 on their own, and the top handful together make up a meaningful share of total revenue. There are two takeaways. The first is that these relationships are worth protecting deliberately, through dedicated account management, early access to products, and loyalty incentives. The second is a note of caution: this is some concentration. If even one or two of these buyers were lost, we'd feel it. So I'd recommend pairing strong retention of these accounts with an effort to grow the next tier of customers and broaden the base.

Your final question was for a single view of demand across all countries, excluding the UK, to guide expansion. This map shades each country by the number of units sold, so you can read the whole picture at a glance, with no scrolling or hovering. The darkest areas are the Netherlands and Ireland, with healthy demand across Western Europe and a clear pocket in Australia. Think of this as your expansion shortlist on one screen. The markets already pulling the most volume are the lowest-risk places to invest further, because we'd be deepening demand that already exists rather than building it from nothing.

So to bring it together. Revenue is seasonal and peaks in the autumn, so we should plan ahead for that surge. Outside the UK, the Netherlands, Ireland, Germany, and France are our strongest markets, with Australia a genuine outlier worth watching. Our top customers are high-value but concentrated, so retention and broadening the base should move in parallel. And the demand map gives us a clear, low-risk shortlist for where to expand next.

My recommendation is to prioritize those proven Western European markets, led by the Netherlands and Ireland, for the next phase of expansion, while protecting our key accounts and preparing operations for the autumn peak. Thank you.
